github.com/imgigin2003
linkedin.com/in/negin-parseh
Kermanshah, Iran

SKILLS

Programming Languages

Python, JavaScript, Rust, HTML, CSS

Frameworks/Libraries

React, Node.js, Streamlit, D3.js, TailwindCSS

AI/ML

Machine Learning, Deep Learning, CNN+LSTM Architectures, Model Evaluation (Recall/F1-based tuning), Multimodal AI, LLMs, Data Analysis, AI Pipelines

Software Development

Full-Stack Development, System Design, Microservices, Data Structures, Algorithms, Git, GitHub, Web Application Development

Other

Problem Solving, Technical Writing, Project Management, Agile Methodologies

EDUCATION

Bachelor of Science (B.Sc.) in Professional Engineering of Computer Software

Technical and Vocational University (TVU) of Iran

GPA: 17.13/20.00 (≈85.6% · ~3.43/4.0 equivalent)

LANGUAGES

English (Advanced)
Persian (Native)

SUMMARY

Results-oriented Software Engineer with 2 years of experience in Rust, Python, and full-stack web development. Strong foundation in Computer Software Engineering with hands-on applied machine learning experience, including designing, debugging, and evaluating a full CNN+LSTM audio classification pipeline end to end. Adept at building scalable, high-performance applications and solving complex, ambiguous engineering problems.

EXPERIENCE

Freelance Software Engineer & Full-Stack Developer

Remote | January 2025 - Present

- Delivered full-stack applications in Rust, Python, React, and Node.js across multiple independent client projects, owning each build from requirements through deployment.
- Diagnosed and resolved production-quality bugs and performance bottlenecks across client codebases, prioritizing maintainable, well-documented solutions over quick patches.
- Evaluated and adopted new frameworks and tools per project needs, balancing delivery speed against long-term code quality.

Software Engineer & Full-Stack Developer

Private Company, Iran | Sep 2023 - Jan 2025

- Built and maintained backend services in Rust and Python supporting production traffic, with a focus on performance and scalability under real usage.
- Owned features across the full stack (React/JavaScript frontend, Rust/Python backend), from requirement gathering through testing and deployment.
- Collaborated within a cross-functional Agile team, contributing to microservices architecture decisions and data-driven system design.

PROJECTS

HG-db (Rust)

Developed a high-performance storage engine/database using Rust, demonstrating systems programming, memory management, and efficient custom data structures.

InsightGraph (JavaScript/Python – Algorithm Visualizer)

Built a full-stack algorithm and graph visualizer (React/FastAPI) animating 16 algorithms (Dijkstra, A*, Bellman-Ford, hypergraph traversal, and more) step-by-step via a pure-function “trace” architecture enabling play/pause/scrub/compare-mode for free. Includes a 34-test suite across frontend and backend.

StudySprout (JavaScript/Full-Stack)

Built a gamified productivity platform with a full-stack architecture (React, Node.js, MongoDB), emphasizing intuitive UX and robust backend integration.

AffectCare (Python – CNN+LSTM Audio Classifier)

Built a CNN+LSTM audio classifier for vocal distress detection (screams, cries for help, panic) in elderly-care monitoring, achieving 88.75% recall on a held-out test set. Used F1-based early stopping, gradient clipping, and a weighted loss function to deliberately prioritize catching emergencies over minimizing false alarms; a dataset audit also surfaced a real spurious-correlation issue (siren vs. scream confusion).
